# PHENYL LINKED QUINOLINYL MODULATORS OF ROR $\gamma$ T

## CROSS-REFERENCE TO RELATED APPLICATIONS

This application claims priority from U.S. Application No. 61/714,433, filed on Oct. 16, 2012, and U.S. Application No. 61/725,537, filed on Nov. 13, 2012, each of which is incorporated herein by reference.

## FIELD OF THE INVENTION

The invention is directed to substituted quinoline compounds, which are modulators of the nuclear receptor ROR $\gamma$ T, pharmaceutical compositions, and methods for use thereof. More particularly, the ROR $\gamma$ T modulators are useful for preventing, treating or ameliorating an ROR $\gamma$ T mediated inflammatory syndrome, disorder or disease.

## BACKGROUND OF THE INVENTION

Retinoic acid-related nuclear receptor gamma t (ROR $\gamma$ T) is a nuclear receptor, exclusively expressed in cells of the immune system, and a key transcription factor driving Th17 cell differentiation. Th17 cells are a subset of CD4<sup>+</sup> T cells, expressing CCR6 on their surface to mediate their migration to sites of inflammation, and dependent on IL-23 stimulation, through the IL-23 receptor, for their maintenance and expansion. Th17 cells produce several proinflammatory cytokines including IL-17A, IL-17F, IL-21, and IL-22 (Korn, T., E. Bettelli, et al. (2009). "IL-17 and Th17 Cells." *Annu Rev Immunol* 27: 485-517.), which stimulate tissue cells to produce a panel of inflammatory chemokines, cytokines and metalloproteases, and promote recruitment of granulocytes (Kolls, J. K. and A. Linden (2004). "Interleukin-17 family members and inflammation." *Immunity* 21(4): 467-76; Stamp, L. K., M. J. James, et al. (2004). "Interleukin-17: the missing link between T-cell accumulation and effector cell actions in rheumatoid arthritis" *Immunol Cell Biol* 82(1): 1-9). Th17 cells have been shown to be the major pathogenic population in several models of autoimmune inflammation, including collagen-induced arthritis (CIA) and experimental autoimmune encephalomyelitis (EAE) (Dong, C. (2006). "Diversification of T-helper-cell lineages: finding the family root of IL-17-producing cells." *Nat Rev Immunol* 6(4): 329-33; McKenzie, B. S., R. A. Kastelein, et al. (2006). "Understanding the IL-23-IL-17 immune pathway." *Trends Immunol* 27(1): 17-23.). ROR $\gamma$ T-deficient mice are healthy and reproduce normally, but have shown impaired Th17 cell differentiation in vitro, a significantly reduced Th17 cell population in vivo, and decreased susceptibility to EAE (Ivanov, I I, B. S. McKenzie, et al. (2006). "The orphan nuclear receptor ROR $\gamma$  directs the differentiation program of proinflammatory IL-17<sup>+</sup> T helper cells." *Cell* 126(6): 1121-33.). Mice deficient for IL-23, a cytokine required for Th17 cell survival, fail to produce Th17 cells and are resistant to EAE, CIA, and inflammatory bowel disease (IBD) (Cua, D. J., J. Sherlock, et al. (2003). "Interleukin-23 rather than interleukin-12 is the critical cytokine for autoimmune inflammation of the brain." *Nature* 421(6924): 744-8.; Langrish, C. L., Y. Chen, et al. (2005). "IL-23 drives a pathogenic T cell population that induces autoimmune inflammation." *J Exp Med* 201(2): 233-40; Yen, D., J. Cheung, et al. (2006). "IL-23 is essential for T cell-mediated colitis and promotes inflammation via IL-17 and IL-6." *J Clin Invest* 116(5): 1310-6.). Consistent with these findings, an anti-IL23-specific monoclonal antibody

blocks development of psoriasis-like inflammation in a murine disease model (Tonel, G., C. Conrad, et al. "Cutting edge: A critical functional role for IL-23 in psoriasis." *J Immunol* 185(10): 5688-91).

In humans, a number of observations support the role of the IL-23/Th17 pathway in the pathogenesis of inflammatory diseases. IL-17, the key cytokine produced by Th17 cells, is expressed at elevated levels in a variety of allergic and autoimmune diseases (Barczyk, A., W. Pierzchala, et al. (2003). "Interleukin-17 in sputum correlates with airway hyperresponsiveness to methacholine." *Respir Med* 97(6): 726-33.; Fujino, S., A. Andoh, et al. (2003). "Increased expression of interleukin 17 in inflammatory bowel disease." *Gut* 52(1): 65-70.; Lock, C., G. Hermans, et al. (2002). "Gene-microarray analysis of multiple sclerosis lesions yields new targets validated in autoimmune encephalomyelitis." *Nat Med* 8(5): 500-8.; Krueger, J. G., S. Fretzin, et al. "IL-17A is essential for cell activation and inflammatory gene circuits in subjects with psoriasis." *J Allergy Clin Immunol* 130(1): 145-154 e9.). Furthermore, human genetic studies have shown association of polymorphisms in the genes for Th17 cell-surface receptors, IL-23R and CCR6, with susceptibility to IBD, multiple sclerosis (MS), rheumatoid arthritis (RA) and psoriasis (Gazouli, M., I. Pachoula, et al. "NOD2/CARD15, ATG16L1 and IL23R gene polymorphisms and childhood-onset of Crohn's disease." *World J Gastroenterol* 16(14): 1753-8., Nunez, C., B. Dema, et al. (2008). "IL23R: a susceptibility locus for celiac disease and multiple sclerosis?" *Genes Immun* 9(4): 289-93.; Bowes, J. and A. Barton "The genetics of psoriatic arthritis: lessons from genome-wide association studies." *Discov Med* 10(52): 177-83; Kochi, Y., Y. Okada, et al. "A regulatory variant in CCR6 is associated with rheumatoid arthritis susceptibility." *Nat Genet.* 42(6): 515-9.).

Ustekinumab (Stelara®), an anti-p40 monoclonal antibody blocking both IL-12 and IL-23, is approved for the treatment of adult patients (18 years or older), with moderate to severe plaque psoriasis, who are candidates for phototherapy or systemic therapy. Currently, monoclonal antibodies specifically targeting only IL-23, to more selectively inhibit the Th17 subset, are also in clinical development for psoriasis (Garber K. (2011). "Psoriasis: from bed to bench and back" *Nat Biotech* 29, 563-566), further implicating the important role of the IL-23- and ROR $\gamma$ T-driven Th17 pathway in this disease. Results from recent phase II clinical studies strongly support this hypothesis, as anti-IL-17 receptor and anti-IL-17 therapeutic antibodies both demonstrated high levels of efficacy in patients with chronic psoriasis (Papp, K. A., "Brodalumab, an anti-interleukin-17-receptor antibody for psoriasis." *N Engl J Med* 2012 366(13): 1181-9.; Leonardi, C., R. Matheson, et al. "Anti-interleukin-17 monoclonal antibody ixekizumab in chronic plaque psoriasis." *N Engl J Med* 366(13): 1190-9.). Anti-IL-17 antibodies have also demonstrated clinically relevant responses in early trials in RA and uveitis (Hueber, W., Patel, D. D., Dryja, T., Wright, A. M., Koroleva, I., Bruin, G., Antoni, C., Draelos, Z., Gold, M. H., Durez, P., Tak, P. P., Gomez-Reino, J. J., Foster, C. S., Kim, R. Y., Samson, C. M., Falk, N. S., Chu, D. S., Callanan, D., Nguyen, Q. D., Rose, K., Haider, A., Di Padova, F. (2010) Effects of AIN457, a fully human antibody to interleukin-17A, on psoriasis, rheumatoid arthritis, and uveitis. *Sci Transl Med* 2, 5272.).

All the above evidence supports inhibition of the Th17 pathway by modulating ROR $\gamma$ T activity as an effective strategy for the treatment of immune-mediated inflammatory diseases.

#### Methods of Use

The present invention is directed to a method for preventing, treating or ameliorating a ROR $\gamma$ t mediated inflammatory syndrome, disorder or disease comprising administering to a subject in need thereof an effective amount of a compound of Formula I or a form, composition or medicament thereof.

Since ROR $\gamma$  is an N-terminal isoform of ROR $\gamma$ , it is recognized that compounds of the present invention which are modulators of ROR $\gamma$ t are likely to be modulators of ROR $\gamma$  as well. Therefore the mechanistic description "ROR $\gamma$ t modulators" is intended to encompass ROR $\gamma$  modulators as well.

When employed as ROR $\gamma$ t modulators, the compounds of the invention may be administered in an effective amount within the dosage range of about 0.5 mg to about 10 g, preferably between about 0.5 mg to about 5 g, in single or divided daily doses. The dosage administered will be affected by factors such as the route of administration, the health, weight and age of the recipient, the frequency of the treatment and the presence of concurrent and unrelated treatments.

It is also apparent to one skilled in the art that the therapeutically effective dose for compounds of the present invention or a pharmaceutical composition thereof will vary according to the desired effect. Therefore, optimal dosages to be administered may be readily determined by one skilled in the art and will vary with the particular compound used, the mode of administration, the strength of the preparation, and the advancement of the disease condition. In addition, factors associated with the particular subject being treated, including subject age, weight, diet and time of administration, will result in the need to adjust the dose to an appropriate therapeutic level. The above dosages are thus exemplary of the average case. There can, of course, be individual instances where higher or lower dosage ranges are merited, and such are within the scope of this invention.

The compounds of Formula I may be formulated into pharmaceutical compositions comprising any known pharmaceutically acceptable carriers. Exemplary carriers include, but are not limited to, any suitable solvents, dispersion media, coatings, antibacterial and antifungal agents and isotonic agents. Exemplary excipients that may also be components of the formulation include fillers, binders, disintegrating agents and lubricants.

The pharmaceutically-acceptable salts of the compounds of Formula I include the conventional non-toxic salts or the quaternary ammonium salts which are formed from inorganic or organic acids or bases. Examples of such acid addition salts include acetate, adipate, benzoate, benzenesulfonate, citrate, camphorate, dodecylsulfate, hydrochloride, hydrobromide, lactate, maleate, methanesulfonate, nitrate, oxalate, pivalate, propionate, succinate, sulfate and tartrate. Base salts include ammonium salts, alkali metal salts such as sodium and potassium salts, alkaline earth metal salts such as calcium and

magnesium salts, salts with organic bases such as dicyclohexylamino salts and salts with amino acids such as arginine. Also, the basic nitrogen-containing groups may be quaternized with, for example, alkyl halides.

The pharmaceutical compositions of the invention may be administered by any means that accomplish their intended purpose. Examples include administration by parenteral, subcutaneous, intravenous, intramuscular, intraperitoneal, transdermal, buccal or ocular routes. Alternatively or concurrently, administration may be by the oral route. Suitable formulations for parenteral administration include aqueous solutions of the active compounds in water-soluble form, for example, water-soluble salts, acidic solutions, alkaline solutions, dextrose-water solutions, isotonic carbohydrate solutions and cyclodextrin inclusion complexes.

Additionally, the present invention includes pharmaceutical compositions made by mixing a pharmaceutically acceptable carrier with any of the compounds of the present invention.

#### Polymorphs and Solvates

Furthermore, the compounds of the present invention may have one or more polymorph or amorphous crystalline forms and as such are intended to be included in the scope of the invention. In addition, the compounds may form solvates, for example with water (i.e., hydrates) or common organic solvents. As used herein, the term "solvate" means a physical association of the compounds of the present invention with one or more solvent molecules. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. The term "solvate" is intended to encompass both solution-phase and isolatable solvates. Non-limiting examples of suitable solvates include ethanولات, methanولات, and the like.

It is intended that the present invention include within its scope polymorphs and solvates of the compounds of the present invention. Thus, in the methods of treatment of the present invention, the term "administering" shall encompass the means for treating, ameliorating or preventing a syndrome, disorder or disease described herein with the compounds of the present invention or a polymorph or solvate thereof, which would obviously be included within the scope of the invention albeit not specifically disclosed.

In another embodiment, the invention relates to a compound as described in Formula I for use as a medicament.

In another embodiment, the invention relates to the use of a compound as described in Formula I for the preparation of a medicament for the treatment of a disease associated with an elevated or aberrant ROR $\gamma$ t activity.

The present invention includes within its scope prodrugs of the compounds of this invention. In general, such prodrugs will be functional derivatives of the compounds which are readily convertible in vivo into the required compound. Thus, in the methods of treatment of the present invention, the term "administering" shall encompass the treatment of the various disorders described with the compound specifically disclosed or with a compound which may not be specifically disclosed, but which converts to the specified compound in vivo after administration to the patient. Conventional procedures for the selection and preparation of suitable prodrug derivatives are described, for example, in "Design of Prodrugs", Ed. H. Bundgaard, Elsevier, 1985.

Furthermore, it is intended that within the scope of the present invention, any element, in particular when mentioned in relation to a compound of Formula (I), shall comprise all isotopes and isotopic mixtures of said element, either naturally occurring or synthetically produced, either with natural abundance or in an isotopically enriched form. For example, a reference to hydrogen includes within its scope  $^1\text{H}$ ,  $^2\text{H}$  (D), and  $^3\text{H}$  (T). Similarly, references to carbon and oxygen include within their scope respectively  $^{13}\text{C}$  and  $^{14}\text{C}$  and  $^{16}\text{O}$  and  $^{18}\text{O}$ . The isotopes may be radioactive or non-radioactive. Radiolabelled compounds of formula (I) may comprise a radioactive isotope selected from the group of  $^3\text{H}$ ,  $^{11}\text{C}$ ,  $^{18}\text{F}$ ,  $^{122}\text{I}$ ,  $^{123}\text{I}$ ,  $^{125}\text{I}$ ,  $^{131}\text{I}$ ,  $^{75}\text{Br}$ ,  $^{76}\text{Br}$ ,  $^{77}\text{Br}$  and  $^{82}\text{Br}$ . Preferably, the radioactive isotope is selected from the group of  $^3\text{H}$ ,  $^{11}\text{C}$  and  $^{18}\text{F}$ .

Some compounds of the present invention may exist as atropisomers. Atropisomers are stereoisomers resulting from hindered rotation about single bonds where the steric strain barrier to rotation is high enough to allow for the isolation of the conformers. It is to be understood that all such conformers and mixtures thereof are encompassed within the scope of the present invention.

Where the compounds according to this invention have at least one stereo center, they may accordingly exist as enantiomers or diastereomers. It is to be understood that all such isomers and mixtures thereof are encompassed within the scope of the present invention.

Where the processes for the preparation of the compounds according to the invention give rise to mixture of stereoisomers, these isomers may be separated by conventional techniques such as preparative chromatography. The compounds may be prepared in racemic form, or individual enantiomers may be prepared either by enantiospecific synthesis or by resolution. The compounds may, for example, be resolved into their component enantiomers by standard techniques, such as the formation of diastereomeric pairs by salt formation with an optically active acid, such as (–)-di-p-toluoyl-D-tartaric acid and/or (+)-di-p-toluoyl-L-tartaric acid followed by fractional crystallization and regeneration of the free base. The compounds may also be resolved by formation of diastereomeric esters or amides, followed by chromatographic separation and removal of the chiral auxiliary. Alternatively, the compounds may be resolved using a chiral HPLC column.

During any of the processes for preparation of the compounds of the present invention, it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by means of conventional protecting groups, such as those described in *Protective Groups in Organic Chemistry*, ed. J. F. W. McOmie, Plenum Press, 1973; and T. W. Greene & P. G. M. Wuts, *Protective Groups in Organic Synthesis*, John Wiley & Sons, 1991. The protecting groups may be removed at a convenient subsequent stage using methods known from the art.

Scheme 1 describes the preparation of 6-bromo or 6-iodo-quinolines of Formula IV by various methods (path 1 to 4). In path 1, cyclization of 4-haloanilines II with 2-substituted malonic acids III can be done in refluxing phosphorus oxychloride to provide 6-haloquinolines IV, wherein  $\text{R}^5$  and  $\text{R}^7$  are Cl. Nucleophilic displacement of 2-chloro substitution with sodium methoxide in hot MeOH or toluene gives 6-halo-2-methoxyquinolines IV. Path 2 illustrates the cyclization of amides VI, derived from acylation of 4-haloanilines II with substituted acid chlorides V, in the presence of DMF in hot phosphorus oxychloride to generate 6-haloquinolines IV, wherein  $\text{R}^5$  is H and  $\text{R}^7$  is Cl. In path 3, methyl 2-aminobenzoates VII can undergo acylation with acid chlorides V to form an amide intermediate, which can be further treated with a base, such as sodium ethoxide or lithium bis(trimethylsilyl) amide, to afford 6-halo-4-hydroxyquinolin-2(1H)-ones VIII. Conversion of hydroxyquinolin-2(1H)-ones VIII to 2,4-dichloroquinolines IV can be carried out in refluxing phosphorus oxychloride. Path 4 describes the condensation of anilines II and aldehydes IX in ethanol to form compound X which can be further cyclized in polyphosphoric acid at high temperatures to give quinolinones XI. Conversion to the 4-chloroquinolines IV wherein  $\text{R}^7$  is H can be accomplished in phosphorus oxychloride as previously described.

Scheme 3 illustrates synthetic routes (path 1 to 6) to ketones of Formula XXI. In path 1, Weinreb amide XX can be prepared from acids XIX by reacting with N,O-dimethylhydroxylamine hydrochloride and 1,1-carbonyldiimidazole or with N,O-dimethylhydroxylamine hydrochloride in the pres-

62

ence of a base such as triethylamine or Hunig's base and a coupling reagent such as EDCI. The amides XX can be further treated with Grignard reagents such as  $\text{R}^2\text{MgX}$  (X is Br or Cl) that can be obtained commercially or preformed by treatment of  $\text{R}^2\text{Z}$  with organometallic reagents such as  $i\text{-PrMgCl}$  or  $\text{EtMgCl}$  in THF. Alternatively, Weinreb amides XX can be obtained from acyl chlorides XXII and N,O-dimethylhydroxylamine hydrochloride by using triethylamine or pyridine as a base. 1-Methyl-1H-imidazole can be treated with one equivalent of  $n\text{-BuLi}$  and one equivalent of chlorotriethylsilane at  $-78^\circ\text{C}$ . followed by an additional equivalent of  $n\text{-BuLi}$ , to which the Weinreb amides XX can be added to yield ketones XXI wherein  $\text{R}^2$  is imidazolyl (path 2).

In path 3, halogen and metal exchange of bromides or iodides XXIV with  $i\text{-PrMgCl}\cdot\text{LiCl}$  or  $n\text{-BuLi}$ , followed by addition of aldehydes XXIII affords alcohols XXV. Oxidation of XXV with Dess-Martin periodinane or  $\text{MnO}_2$  can provide ketones XXI. In path 4, ketones XXI, where  $\text{R}^2$  is triazolyl, can be prepared by treatment of 1-methyl-1H-1,2,3-triazole with  $n\text{-BuLi}$  followed by reaction with aldehydes XXIII to yield alcohols XXV, which could undergo oxidation with Dess-Martin periodinane or  $\text{MnO}_2$ . Path 5 exemplifies the preparation of symmetrical ketones XXI, wherein  $\text{R}^1$  and  $\text{R}^2$  are the same. As illustrated, an aryl or heteroaryl group containing an acidic proton XXXIX ( $\text{Y}=\text{R}^1$  or  $\text{R}^2$ ) can be deprotonated in the presence of a strong base such as  $n\text{-butyllithium}$  once solubilized in a preferred solvent such as tetrahydrofuran at temperatures between  $0$  and  $-78^\circ\text{C}$ . then added in excess to ethyl methoxy(methyl)carbamate to provide ketones XXI wherein  $\text{R}^1$  and  $\text{R}^2$  are the same. Aryl or heteroaryl bromide or iodide XL can also be lithiated through a lithium/halogen exchange with  $n\text{-butyllithium}$  before adding in excess to ethyl methoxy(methyl)carbamate as previously described to provide symmetrical ketones XXI. Path 6, which employs palladium catalyzed cross-coupling of arylboronic acids XXXVII with acid chlorides XXXVIII using  $\text{K}_3\text{PO}_4$  as a base and  $(\text{Ph}_3\text{P})_2\text{PdCl}_2$  as a catalyst in a high boiling non-polar solvent such as toluene, can also be used to generate ketones XXI.

Ketones XXVII can be obtained in a two-step process by addition of aldehyde XXVIII to a reaction mixture of aryl

iodides or bromides XXIX and  $i-PrMgCl \cdot LiCl$  followed by oxidation with  $MnO_2$  (path 2). As illustrated in Path 3, a one-pot reaction of aldehydes XXX and Grignard reagents such as  $R^1-MgCl$  XVIII followed by treatment with  $i-PrMgCl$  and addition of 2,2,2-trifluoro-N-methoxy-N-methylacetamide yields hydroxyl compounds XXXI. The organic phase was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated. The residue was purified by flash column chromatography (silica gel, gradient 0-3% MeOH-DCM) to afford the title compound. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 8.36 (d, J=1.71 Hz, 1H), 8.29 (d, J=8.80 Hz, 1H), 7.89 (dd, J=1.59, 8.93 Hz, 1H), 7.41-7.52 (m, 3H), 7.38 (s, 1H), 7.32-7.37 (m, 4H), 7.28-7.31 (m, 2H), 6.43 (s, 1H), 3.40 (s, 3H); MS m/e 562.0 [M+H]<sup>+</sup>.

Example 138a was purified by chiral HPLC (Chiralpak AD, 95% heptane/5% EtOH) to give 2 enantiomers (elution order: Example 138c first, Example 138b second). The separated enantiomers were each converted to HCl salts as follows. A solution of each in DCM was treated with 1 N HCl in Et<sub>2</sub>O (3 equivalents) and the mixtures were concentrated. One of the HCl salts required further purification; it was re-converted to the free base (saturated aqueous NaHCO<sub>3</sub>/DCM extraction) and purified by flash column chromatography (silica gel, gradient 0-3% MeOH-DCM) to afford example 138b.

4-Chloro-6-((4-chlorophenyl)(1,2-dimethyl-1H-imidazol-5-yl)(hydroxymethyl)-3-phenylquinoline-2-carbonitrile•TFA

The title compound was prepared using (4-chlorophenyl)(2,4-dichloro-3-phenylquinolin-6-yl)(1,2-dimethyl-1H-imidazol-5-yl)methanol (Example 15) in place of (4-chlorophenyl)(2,4-dichloro-3-phenylquinolin-6-yl)(1-methyl-1H-imidazol-5-yl)methanol using the procedure described for Example 137a, with the following exceptions. After heating overnight, LCMS analysis showed mainly mono- rather than di-nitrile. In an attempt to convert to di-nitrile, second portions of Pd<sub>2</sub>dba<sub>3</sub>, dppf, and zinc cyanide (amounts equal to the initial loadings) were added, the mixture was evacuated and refilled with argon, and was again heated overnight in a 120° C. oil bath. To a large microwave vial was added (2,4-dichloro-3-phenylquinolin-6-yl)(2,4-dimethylthiazol-5-yl)(1-methyl-1H-1,2,3-triazol-5-yl)methanol (100 mg, 0.200 mmol, Example 149), zinc cyanide (75 mg, 0.64 mmol), 2-dicyclohexylphosphino-2',4',6'-triisopropylbiphenyl (X-Phos, 25 mg, 0.52 mmol), zinc powder (2 mg, 0.031 mmol), Pd<sub>2</sub>(dba)<sub>3</sub> (60 mg, 0.66 mmol) followed by N,N-dimethylacetamide (3 mL, degassed with N<sub>2</sub> for 10 min). The vial was sealed and evacuated. The mixture was heated to 120° C. in an oil bath. After 1.5 hours, the mixture was filtered while still warm through Celite® and rinsed with EtOAc. The light yellow effluent was concentrated and the N,N-dimethylacetamide was partially removed under high vacuum. The crude material was chromatographed on silica gel (3-8% MeOH-DCM) to provide the product along with residual DMA, which after trituration with Et<sub>2</sub>O and hexane gave the title compound as a pale yellow foam. <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>) δ 8.54 (s, 1H), 8.27 (d, J=8.9 Hz, 1H), 7.81 (d, J=9.0 Hz, 1H), 7.71-7.54 (m, 5H), 7.12 (s, 1H), 6.10 (s, 1H), 3.97 (s, 3H), 2.58 (d, J=18.6 Hz, 3H), 2.14 (s, 3H). After 5 min, additional THF (2.6 mL) was added to aid the dissolution of the ketone, and the reaction became an opaque easily stirred tan slurry within 30 min. After 110 min, the reaction was quenched with D<sub>2</sub>O (0.2 mL) and partitioned with 5 M NH<sub>4</sub>Cl (1 mL) and heptane (1 mL), and the organic layer was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated. # In Vitro Biological Data ThermoFluor® Assay

ThermoFluor® is a fluorescence based assay that estimates ligand binding affinities by measuring the effect of a ligand on protein thermal stability (Pantoliano, M. W., Petrella, E. C., Kwasnoski, J. D., Lobanov, V. S., Myslik, J., Graf, E., Carver, T., Asel, E., Springer, B. A., Lane, P., and Salemme, F. R. (2001) High-density miniaturized thermal shift assays as a general strategy for drug discovery. *J Biomol Screen* 6, 429-40, and Matulis, D., Kranz, J. K., Salemme, F. R., and Todd, M. J. (2005) Thermodynamic stability of carbonic anhydrase: measurements of binding affinity and stoichiometry using ThermoFluor. *Biochemistry* 44, 5258-66). This approach is applicable to a wide variety of systems, and rigorous in theoretical interpretation through quantitation of equilibrium binding constants ( $K_D$ ).

In a ThermoFluor® experiment where protein stability is monitored as the temperature is steadily increased, an equilibrium binding ligand causes the midpoint of an unfolding transition ( $T_m$ ) to occur at a higher temperature. The shift in the melting point described as a  $\Delta T_m$  is proportional to the concentration and affinity of the ligand. The compound potency may be compared as a rank order of either  $\Delta T_m$  values at a single compound concentration or in terms of  $K_D$  values, estimated from concentration response curves.

## RORyt ThermoFluor® Assay Construct

For the RORyt construct used in the ThermoFluor® assay, numbering for the nucleotide sequences was based on the reference sequence for human RORyt, transcript variant 2, NCBI Accession: NM\_001001523.1 (SEQ ID NO:1). Nucleotides 850-1635 (SEQ ID NO:2) coding for the wild type human RORyt ligand binding domain (RORyt LBD) were cloned into the pHIS1 vector, a modified pET *E. coli* expression vector (Accelagen, San Diego), containing an in-frame N-terminal His-tag and a TurboTEV protease cleavage site (ENLYFQG, SEQ ID NO:3) upstream of the cloned insert sequence. The amino acid sequence for the RORyt construct used in the ThermoFluor assay is shown as SEQ ID NO:4.

ThermoFluor® experiments were carried out using instruments owned by Janssen Research and Discovery, L.L.C. through its acquisition of 3-Dimensional Pharmaceuticals, Inc. 1,8-ANS (Invitrogen) was used as a fluorescent dye. Protein and compound solutions are dispensed into black 384-well polypropylene PCR microplates (Abgene) and overlaid with silicone oil (1  $\mu$ L Fluka, type DC 200) to prevent evaporation.

Bar-coded assay plates are robotically loaded onto a thermostatically controlled PCR-type thermal block and then heated at a typical ramp-rate of 1° C./min for all experiments. Fluorescence was measured by continuous illumination with UV light (Hamamatsu LC6) supplied via fiber optic and filtered through a band-pass filter (380-400 nm; >6 OD cutoff). Fluorescence emission of the entire 384-well plate was detected by measuring light intensity using a CCD camera (Sensys, Roper Scientific) filtered to detect 500±25 nm, resulting in simultaneous and independent readings of all 384 wells. Images were collected at each temperature, and the sum of the pixel intensity in a given area of the assay plate was recorded versus temperature. Reference wells contained RORyt without compounds, and the assay conditions were as follows:

0.065 mg/mL RORyt  
60  $\mu$ M 1,8-ANS  
100 mM Hepes, pH 7.0  
10 mM NaCl  
2.5 mM GSH  
0.002% Tween-20

Project compounds were arranged in a pre-dosed mother plate (Greiner Bio-one) wherein compounds are serially diluted in 100% DMSO by 1:2 from a high concentration of 10 mM over 12 columns within a series (column 12 is a reference well containing DMSO, no compound).

The compounds were robotically dispensed directly into assay plates (1×46 mL) using a Hummingbird capillary liquid handling instrument (Digilab). Following compound dispense, protein and dye in buffer was added to achieve the final assay volume of 3  $\mu$ L, followed by 1  $\mu$ L of silicone oil.

The binding affinity was estimated as described previously (Matulis, D., Kranz, J. K., Salemme, F. R., and Todd, M. J. (2005) Thermodynamic stability of carbonic anhydrase: measurements of binding affinity and stoichiometry using ThermoFluor. *Biochemistry* 44, 5258-66) using the following thermodynamic parameters of protein unfolding:

Reference RORyt  $T_m$ : 47.8° C.

$\Delta H_{(T_m)}$ =115 kcal/mol

$\Delta C_{p(T_m)}$ =3 kcal/mol

## Cell Based Biological Data

### RORyt Reporter Assay

A reporter assay was used to test functional activity of RORyt modulatory compounds on transcriptional activation driven by the RORyt LBD. Cells used in the assay were co-transfected with two constructs. The first construct, pBIND-RORyt LBD, contained the wild type human RORyt LBD fused to the DNA binding domain of the GAL4 protein. The second construct, pGL4.31 (Promega Cat no. C935A), contained multiple GAL4 responsive DNA elements upstream of firefly luciferase. To generate a background control, cells were similarly co-transfected with two constructs, but in the first construct the AF2 amino acid motif in the RORyt LBD was changed from LYKELF (SEQ ID NO:5) to LFKELF (SEQ ID NO:6). The AF2 mutation has been shown to prevent co-activator binding to the RORyt LBD, thus preventing transcription of firefly luciferase. The mutant construct was called pBIND-RORyt-AF2.

For the RORyt constructs used in the reporter assay, numbering for the nucleotide sequences was also based on the reference sequence for human RORyt, transcript variant 2, NCBI Accession: NM\_001001523.1 (SEQ ID NO:1). For the wild type human RORyt LBD construct, pBIND-RORyt LBD, nucleotides 850-1635 (SEQ ID NO:2) coding for the wild type human RORyt LBD were cloned into EcoRI and NotI sites in the pBIND vector (Promega cat. No E245A). The pBIND vector contains the GAL4 DNA Binding Domain (GAL4 DBD) and the *renilla* luciferase gene under control of the SV40 promoter. *Renilla* luciferase expression serves as a control for transfection efficiency and cell viability. For the background control construct, pBIND-RORyt-AF2, the AF2 domain of RORyt LBD was mutated using the Quik Change II Site Directed Mutagenesis System (Stratagene Cat. No. 200519). The nucleotide sequence coding for the RORyt LBD sequence with the mutated AF2 domain is shown as SEQ ID NO:7. The amino acid sequences for the wild type RORyt LBD and RORyt LBD with the mutated AF2 domain are shown as SEQ ID NO:8 and SEQ ID NO:9, respectively.

The reporter assay was performed by transiently transfecting HEK293T cells with 5 ng of pBIND-RORyt LBD or pBIND-RORyt LBD-AF2 and 5  $\mu$ g pGL4.31 (Promega Cat no. C935A) using Fugene 6 (Invitrogen Cat no. E2691) at a 1:6 ratio of DNA:Fugene 6 in a T-75 flask in which cells were at least 80% confluent. Twenty four hours after bulk transfection, cells were plated into 96-well plates at 50,000 cells/well in phenol-red free DMEM containing 5% Lipid Reduced FCS and Pen/Strep. Six hours after plating, cells were treated with compounds for 24 hours. Media was removed and cells were

lysed with 50  $\mu$ L 1 $\times$  Glo Lysis Buffer (Promega). Dual Glo Luciferase Reagent (50  $\mu$ L/well) was then added and firefly luciferase luminescence was read on an Envision after a ten minute incubation. Finally, Stop and Glo reagent (50  $\mu$ L/well) was added and *renilla* luciferase luminescence was read on an Envision after a ten minute incubation. To calculate the effect of compounds on ROR $\gamma$ t activity, the ratio of firefly to *renilla* luciferase was determined and plotted against compound concentration. Agonist compounds increase ROR $\gamma$ t-driven luciferase expression, and antagonist or inverse agonist compounds decrease luciferase expression.

## Human Th17 Assay

The human Th17 assay tests the effect of ROR $\gamma$ t modulatory compounds on IL-17 production by CD4 $^{+}$  T cells under conditions which favor Th17 differentiation. Total CD4 $^{+}$  T cells were isolated from the peripheral blood mononuclear cells (PBMC) of healthy donors using a CD4 $^{+}$  T cell isolation kit II, following the manufacturer's instructions (Miltenyi Biotec). Cells were resuspended in a medium of RPMI-1640

supplemented with 10% fetal bovine serum, penicillin, streptomycin, glutamate, and  $\beta$ -mercaptoethanol and were added to 96-well plates at  $1.5 \times 10^5$  per 100  $\mu$ L per well. 50  $\mu$ L of compound at titrated concentrations in DMSO were added into each well at final DMSO concentration at 0.2%. Cells were incubated for 1 hour, then 50  $\mu$ L of Th17 cell differentiation medium was added to each well. The final concentrations of antibodies and cytokines (R&D Systems) in differentiation medium were:  $3 \times 10^6$ /mL anti-CD3/CD28 beads (prepared using human T cell activation/expansion kit, Miltenyi Biotec), 10  $\mu$ g/mL anti-IL4, 10  $\mu$ g/mL anti-IFN $\gamma$ , 10 ng/mL IL113, 10 ng/mL IL23, 50 ng/mL IL6, 3 ng/mL TGF $\beta$  and 20 U/mL IL2. Cells were cultured at 37 $^{\circ}$  C. and 5% CO $_2$  for 3 days. Supernatants were collected and the accumulated IL-17 in culture was measured by using MULTI-SPOT $^{\circ}$  Cytokine Plate following manufacture's instruction (Meso Scale Discovery). The plate was read using Sector Imager 6000, and IL-17 concentration was extrapolated from the standard curve. The IC $_{50}$ s were determined by GraphPad.
